

Scenario

I am a level one security operations center (SOC) analyst at a financial services company. I have received an alert about a suspicious file being downloaded on an employee's computer.

I investigated this alert and discovered that the employee received an email containing an attachment. The attachment was a password-protected spreadsheet file. The spreadsheet's password was provided in the email. The employee downloaded the file, then entered the password to open the file. When the employee opened the file, a malicious payload was then executed on their computer.

I retrieve the malicious file and create a SHA256 hash of the file.

Now that I have the file hash, I will use VirusTotal to uncover additional IoCs that are associated with the file.

Here, I opened VirusTotal website, entered the hashed file to the search box and pressed the Enter button. From the results, I can see that the community score is 59 out of 72. The community scored it as a malicious file.

Question: **Has the file been reported as malicious? Explain why or why not.**

The file hash has been reported as malicious by over 50 vendors. Upon further investigation, this file hash is known as the malware Flagpro, which has been commonly used by the advanced threat actor BlackTech.
